#### Importing Required Libraries

```
In [151]:
```

```
import numpy as np
import matplotlib.pyplot as plt
import torch
import torch.nn as nn
import torchvision
import torchvision.transforms as transforms
from torch.utils.data.dataset import TensorDataset
from torch.utils.data import DataLoader
```

## **DATASET LOADING AND PREPARATION**

```
In [152]:
```

```
train_dataset = torchvision.datasets.MNIST(root='./data', train=True, transform=
transforms.ToTensor(), download=True)
test_dataset = torchvision.datasets.MNIST(root='./data', train=False, transform=
transforms.ToTensor())
```

#### In [153]:

```
loader_train = torch.utils.data.DataLoader(dataset=train_dataset,batch_size = le
n(train_dataset) ,shuffle=True)
loader_test = torch.utils.data.DataLoader(dataset=test_dataset,batch_size = len(
test_dataset) ,shuffle=True)
```

#### In [154]:

```
X_train,y_train=next(iter(loader_train))
X_test,y_test=next(iter(loader_test))
```

#### In [155]:

```
X_train=X_train.numpy()
y_train=y_train.numpy()
X_test=X_test.numpy()
y_test=y_test.numpy()
```

#### In [156]:

```
X_train_flattened=X_train.reshape(X_train.shape[0],X_train.shape[1]*X_train.shap
e[2]*X_train.shape[3])
X_test_flattened=X_test.reshape(X_test.shape[0],X_test.shape[1]*X_test.shape[2]*
X_test.shape[3])
```

#### One-Hot Encoding

```
In [157]:
```

```
train_labels_encoded = []
for i in y_train:
    A=np.array([0]*10)
    A[i]=1
    train_labels_encoded.append(A)
y_train_encoded=np.array(train_labels_encoded)
```

## In [158]:

```
test_labels_encoded = []
for i in y_test:
    A=np.array([0]*10)
    A[i]=1
    test_labels_encoded.append(A)
y_test_encoded=np.array(test_labels_encoded)
```

## In [159]:

```
X_train_flattened_torch=torch.from_numpy(X_train_flattened)
y_train_encoded_torch=torch.from_numpy(y_train_encoded)
```

#### In [160]:

```
X_test_flattened_torch=torch.from_numpy(X_test_flattened)
y_test_encoded_torch=torch.from_numpy(y_test_encoded)
```

Here we have prepared test and train dataset with flattenned images and one hot encoded labels

```
In [161]:
```

```
Train_Dataset=TensorDataset(X_train_flattened_torch,y_train_encoded_torch)
```

#### In [162]:

```
Test Dataset=TensorDataset(X test flattened torch,y test encoded torch)
```

# **HELPER FUNCTIONS**

```
In [163]:
```

```
def relu(z):
    return np.maximum(0,z)

def softmax(z):
    return np.exp(z)/sum(np.exp(z))
```

```
In [164]:
```

```
def dif_relu(z):
    return z>0
```

#### In [165]:

```
def glorot_initialisation(output_n,input_n):
    M=np.sqrt(6/(input_n+output_n))
    W=np.random.uniform(low=-M, high=M, size=(output_n,input_n))
    b=np.random.uniform(low=-M, high=M, size=(output_n,1))
    return W,b
```

## In [166]:

```
def initialize parameters(layer dims):
   Arguments:
   layer dims -- python array (list) containing the dimensions of each layer in
our network
   Returns:
   parameters -- python dictionary containing your parameters "W1", "b1", ...,
 "WL", "bL":
                    W1 -- weight matrix of shape (layer dims[1], layer dims[1-
11)
                    b1 -- bias vector of shape (layer dims[1], 1)
                    Wl -- weight matrix of shape (layer_dims[1-1], layer dims
[1])
                    bl -- bias vector of shape (1, layer dims[1])
    Tips:
   - For example: the layer dims for the "Planar Data classification model" wou
1d have been [2,2,1].
    This means W1's shape was (2,2), b1 was (1,2), W2 was (2,1) and b2 was (1,2)
1). Now you have to generalize it!
    - In the for loop, use parameters['W' + str(1)] to access W1, where 1 is the
iterative integer.
   np.random.seed(1390)
   parameters = {}
   L = len(layer dims) # number of layers in the network
   for 1 in range(1, L):
        # M=np.sqrt(6/(self.input n+self.output n))
        parameters['W' + str(1)],parameters['b' + str(1)] = glorot initialisati
on(layer dims[1], layer dims[1-1])
        assert(parameters['W' + str(1)].shape == (layer dims[1], layer dims[1-1
]))
        assert(parameters['b' + str(1)].shape == (layer dims[1], 1))
   return parameters
```

In [167]:

```
def forward propagation(X, parameters):
    SHAPE OF X = 784, samples (i.e. 64 for a batch)
    Implements the forward propagation (and computes the loss) presented in Figu
re 2.
    Arguments:
    X -- input dataset, of shape (input size, number of examples)
    parameters -- python dictionary containing your parameters "W1", "b1", "W2",
"b2", "W3", "b3", "W4", "b4":
                    W1 -- weight matrix of shape (500,784)
                    b1 -- bias vector of shape (500,1)
                    W2 -- weight matrix of shape (250,500)
                    b2 -- bias vector of shape (250,1)
                    W3 -- weight matrix of shape (100,250)
                    b3 -- bias vector of shape (100,1)
                    W4 -- weight matrix of shape (10,100)
                    b4 -- bias vector of shape (10,1)
    Returns:

# REPORTING ACCURACY OF MODEL

TRAIN ACCURACY: 98.43%

TEST ACCURACY: 97.12%

Inference: This model performs better than baseline sigmoid and also better than tanh activation but looks like it is tending to overfit, regularization might help in this case.
